Final Report for period: 15 June 1994 - 14 Nov 1997
Grant AFOSR F49620-94-1-0345
Visual Motion Perception and Visual Information Processing
PI: George Sperling, University of California, Irvine, CA

ABSTRACT

The reprints enclosed with this report describe experiments related to two main thrusts of the grant: motion perception and, more generally, visual information processing. In the domain of motion perception, the implementation of a new pedestal paradigm and some critical subsidiary paradigms (interocular displays, stimulus superpositions with varying phases and directions, alternating-feature stimuli, and attentional manipulations) enabled the measurement in isolation of the spatial and temporal characteristics of the three main human motion perception mechanisms (the so-called first-, second, and third-order systems). The first- and second-order systems, known previously, were now shown to exist in duplicate, having a primarily left eye and a primarily right eye computational branch. Additionally, a purely binocular (third-order) motion mechanism was discovered and measured. The functional architecture relating these five motion computations to human motion perception is described in Lu & Sperling (VisRes, 1995) and Lu and Sperling (Nature, 1995). In the domain of information processing, a computational theory of spatial attention that accounts for human performance in the major paradigms for studying attention was completed and published (Sperling & Weichselgartner, 1995). Other studies related to these issues are described in the appended publications.

OVERVIEW

The main activities throughout this grant have been carrying out the experimental research set forth in the proposal (1994), following up promising leads that developed in the course of this work, and preparing manuscripts for publication. A list of scientific articles and talks presented at scientific conferences is appended.

Knowing how humans perceive visual motion is of great potential importance in the design of visual displays. An understanding of the mechanisms of spatial visual attention would be useful to the designers of displays that present visual information from several sources to pilots and controllers who have to deal with information overload, and in the selection and training of personnel to view these displays. The accomplishments are described in the publications and technical reports; a list is appended followed by the publications in the order listed.

FACILITIES

The Human Information Processing Laboratory (HIPLab) is a highly versatile laboratory for conducting research in almost any area of vision or cognition as described in

previous progress reports.

PERSONNEL

Principle investigator. George Sperling, Professor of Psychology and Director of the Human Information Processing Laboratory. As projected in the original proposal, the PI devoted 20% time during 9 month academic year plus full time during three summer months.

Research Associate 1. Zhong-Lin Lu (full-time). Dr. Lu received his doctorate in low-temperature physics from NYU for projects related to neuromagnetic recording. He has changed fields and applied his considerable technical skills to projects in visual motion perception and to related mathematical and computational issues. He left in Fall, 1995, to assume a tenure-track faculty position at the Departments of Psychology and the Program in Neural, Informational and Behavioral Sciences, University of Southern California, Los Angeles.

Research Associate 2. Charles Chubb (part-time). Prof. Chubb, an experimental-theoretical psychologist was on leave from a regular faculty position at Rutgers University, New Brunswick, NJ. He worked on projects in motion and texture perception and theory and on a new kind of neural network for unsupervised visual pattern learning.

Research Associate 2. Eric Fredericksen. Dr. Fredericksen received his PhD in Computer Science at University of North Carolina and came to UCI in August 1996 from a previous postdoctoral position at McGill University in visual psychophysics with Robert Hess. So far, at his insistence, he has worked only on software development of a new real-time graphics package and has not participated in any psychophysical experiments.

Administrative assistant. Ms. Lauren Haines. Ms. Haines is supported 1/4 time on this grant and 1/4 time by the Department of Cognitive Sciences.

Graduate students

Eric Blaser. Mr. Blaser completed preliminary experiments for a project involving the measurement of spatial attention. In the preliminary experiments he has succeeded in measuring the spatial frequency response function of spatial visual attention, and he is now refining the paradigm to confirm these results and to complete his PhD thesis in Department of Cognitive Sciences at UCI.

Scott Richman. Mr. Richman is a student in the Institute for Mathematical Behavioral Sciences who has joined the laboratory. He worked initially on a project to measure the contributions of flicker to second-order motion, and he then worked on a project in texture perception.

6. PUBLICATIONS

These are listed in the attached pages, and describe in detail the research progress.

7. INTERACTIONS

These are enumerated in the lists of talks at conferences and at universities and institutes (on the following pages).

9. HONORS

1996. Society of Experimental Psychologists. *Howard Cosby Warren Medal, 1996*. The Society of Experimental Psychologists (SEP) is a national honorary society for experimental psychologists. The Warren Medal is the highest honor bestowed by SEP and is awarded annually for an outstanding research accomplishment. (Bronze plaque, citation, \$500.)

August 1, 1996. *Atoms of the Mind: An Historical Overview of Theories of Attention.*
August 2, 1996. Vision Discussion Group: Visual Preprocessing: Modeling the Initial Stages of Human Visual Perception.
- 1996 Biology Colloquium, Australian National University, Research School of Biological Sciences, Center for Visual Sciences, Canberra, Australia, August 6, 1996. *Computational Principles of Early Visual Processing: From Adaptation to Attention.*
- 1996 California Institute of Technology, Sloan Center for Theoretical Neurobiology and the Computation and Neural Systems program, Sloan Center Seminar October 7, 1996. *A Functional Architecture for Visual Motion Perception and Spatial Attention.*
- 1996 University of California, Irvine, Department of Psychobiology, Departmental Colloquium, October 10, 1996. *Deriving a Functional Architecture for Visual Motion Perception and Spatial Attention.*
- 1997 Max Planck Institute, Munich, Germany. April 2, 1997. *Computational Review of Early Visual Processing.*
- 1997 Max Planck Institute, Tuebingen, Germany. April 3, 1997. *How to Experimentally Isolate Three Systems of Visual Motion Perception.*
- 1997 University of Houston, Houston, Texas, December 6, 1997.
(1) College of Optometry, Seminar. *The Orders of Visual Motion--Techniques for Creating Pure Stimuli.*
(2) Institute of Cognitive Sciences Distinguished Speakers Series. *Deriving a Function Architecture for Visual Motion Perception.*
